

IC Measurement Project

Name: VISHAL BHARADWAJ

Roll no: IITBBS0125-10403

0.0Analysis of data gathered in nominal condition (VDD = 3 V, TA = 25C, AGAIN = 16, AEN = 1)

1.0 verify sensor reading counts proportional to atime for all channels

1.1 verify sensor reading counts proportional to gain for all channels

2.0 characterize the affect of wait time on sensor reading counts

2.1 verify sensor reading counts [jitter] vs gain and vs atime

3.0 measure [mean, jitter] in dark sensor reading counts vs gain and vs atime

4.0 verify colour sensor functionality (example: red colour light should output higher counts in red channel counts)

RGB Channel Contribution for Red Incident Light

6.0 determine the min and max I2C clock frequency for reliable communication
